EXAMINATION QUESTION PAPER

MODULE CODE	HSOR414
MODULE NARRATION	DYNAMIC PROGRAMMING AND INVENTORY MODELS
DATE	
DURATION	3 HOURS

INSTRUCTIONS TO CANDIDATES:

1. Answer **ANY FOUR** questions.
2. Each question carries **25 MARKS**.

A1. Suppose that you want to invest \$4000 now and \$2000 at the start of years 2 and 4. The interest rate offered by First Bank is 8% compounded annually, and the bonuses over the next 4 years are 1.8%, 1.7%, 2.1% and 2.5%, respectively. The annual interest rate offered by Second Bank is 0.2% lower than that of First bank, but its bonus is 0.5% higher. The objective is to maximize the accumulated capital at the end of 4 years. [25]

A2. (a) PK Manufacturing produces two products. The daily capacity of the manufacturing process is 430 minutes. Product 1 requires 2 minutes per unit and product 2 requires 1 minute per unit. There is no limit on the amount produced of product 1, but the maximum daily demand for product 2 is 230 units. The unit profit of 1 is \$2 and that of product 2 is \$5. Find the optimal solution using dynamic programming. [10]

(b) Suppose that there are 3 items and the capacity of the knapsack is 5.

Item (j)	Weight, (w_i)	Benefit (b_j)
1	2	60
2	3	85
3	1	35

What should go on the knapsack so as to maximise total benefit? [15]

A3. (a) A construction constructor estimates that the size of the workforce that will be needed in the next 5 weeks is 6, 5, 3, 6 and 8 workers respectively. Excess labour kept on the force will cost \$300 per worker per week and new hiring in any week will incur a fixed cost of \$400 plus \$200 per worker per week. Firing a worker will cost \$100 Determine an optimal policy for hiring and firing workforce which cost minimum. [15]

(b) Sand Enterprises uses resin in its manufacturing processes at the rate of 1000 gallons per month. It costs Sand Enterprises \$100 to place an order for a new shipment. The holding cost per gallon per month is \$2, and the shortage cost per gallon is \$10. Historical data show that the demand during lead time is uniform over the range (0,100) gallons. Determine the optimal ordering policy for Mak Enterprises. [10]

A4. Suppose that you want to invest \$6000 in the first year, \$3000 in second year, \$2000 in third year and \$2000 in the fourth year. The interest rate offered by First Bank is 7.5% compounded annually, and the bonuses over the next 4 years are 1.6%, 1.8%, 3.1% and 2.1%, respectively. The annual interest rate offered by Second Bank is 12%, but its bonus is 0.2% higher than that of First bank. The objective is to maximize the accumulated capital at the end of 4 years. Find the maximum amounts to be invested in each bank per year. [25]

- A5. (a) A grocery store owner sell a tray of bread for \$2500, where it cost him \$1500 to purchase it. An unsold tray left over at the end of the day is sold for half-price, that is \$1250. Demand in trays is discrete. Demand over the past has shown the pattern in table below:

Number of trays	16	17	18	19	20	21
% time demanded	15	20	19	18	17	11

- (i) Find the optimal number of trays the grocery store should stock each day. [4]
(ii) Find the expected profit, using the optimal solution. [4]
(iii) Find the expected profit for stocking 21 trays and compare your solution with the optimal solution. [2]
- (b) A construction constructor estimates that the size of the workforce that will be needed in the next 5 weeks is 8, 4,7,8 and 2 respectively. Excess labour kept on the force will cost \$500 per worker per week and new hiring in any week will incur a fixed cost of \$400 plus \$400 per worker per week. Determine an optimal plan for the contractor. [15]

END OF QUESTION PAPER

STATISTICAL TABLES

Cumulative normal distribution

Critical values of the t distribution

Critical values of the F distribution

Critical values of the chi-squared distribution

TABLE A.1

Cumulative Standardized Normal Distribution

$A(z)$ is the integral of the standardized normal distribution from $-\infty$ to z (in other words, the area under the curve to the left of z). It gives the probability of a normal random variable not being more than z standard deviations above its mean. Values of z of particular importance:

z	$A(z)$	
1.645	0.9500	Lower limit of right 5% tail
1.960	0.9750	Lower limit of right 2.5% tail
2.326	0.9900	Lower limit of right 1% tail
2.576	0.9950	Lower limit of right 0.5% tail
3.090	0.9990	Lower limit of right 0.1% tail
3.291	0.9995	Lower limit of right 0.05% tail

z	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
